Bushman Panoramic

Thank you for using
Bushman Panoramic Products.

Halo
360 Light
Manual

Open

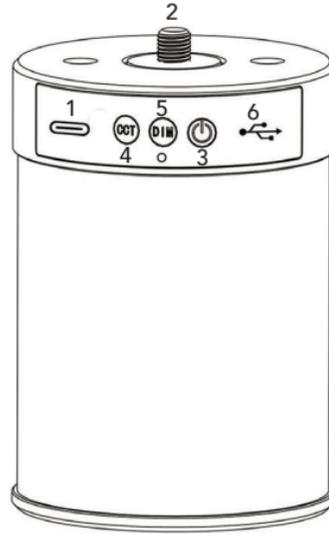

Open the HALO 360 Light, and you may take it out of its box. It is made of aluminium to allow maximum heat dissipation. Please note that the Halo 360 will get very hot when running ON in full power. This is normal with such powerful light.

1) Charging

When you receive the Halo 360 Light, it has been tested and it is not fully charged. Please do charge it when you receive it with the USB-C port. The LED will indicate red. Charging will take over an hour. **It is not possible to turn ON the light when charging it.**

2) Install

The Halo 360 Light has a male 1/4" thread on the top and a female 1/4" on the bottom. This is to easily set up on a 1/4" camera tripod or a Bushman Monopod. On the top of the Halo 360 Light is a red ring that allows a better grip for your camera or for stacking multiple Halo 360 Lights. You can easily screw on the Halo 360 Light on a 1/4" thread.

3) Turn ON / OFF

To turn ON your HALO 360 light:

- press ONCE on the ON/OFF button - a little green LED light will turn ON
- press TWICE the ON/OFF button to turn it OFF - the little LED light will turn OFF

4) Temperature

The Halo 360 Light has 3 different possible color or temperature.

- 3000°F / 4000°F / 5200°F
- Orange / Warm / Cold

You can press "CCT" button and scroll to the necessary temperature.

5) Dimming

The Halo 360 Light has 6 dimmable positions.

- 0% / 20% / 40% / 60% / 80% / 100%

Turn on the dimming on the light, press as follows the DIM button until you have the necessary brightness.

- When on position 0% the Halo 360 Light is still ON and still allows you to change the brightness.

6) USB port

Warning

We have made a closed light for better environment protection. Please note that over 1h of use the light does get very hot. This is not a defect not a cause to open a claim. This is normal and you are using a very powerful light. Store in a dry and safe place.
